                               Claim 2: Pages 53-54; 116pp; English.

The present sequence encodes fibroblast growth factor-2 (FGF-2), a leaderless protein. A leaderless protein refers to a protein that is found in an extracellular environment, but lacks a canonical leader sequence. The specification describes a method for inhibiting export of a leaderless protein from a cell. The method for inhibiting export can leaderless protein from a cell. The method for inhibiting export the cell with an agent that inhibits binding between the leaderless protein and a transport molecule. Treatment with the inhibiting agent is specifically used to treat angiogenesis and restenosis, i.e. where expression of FGF-2 is inhibited, and the agent is applied to endothel or smooth muscle cells. Other applications are treatment of tumours (melanoma, teratocarcinoma, ovarian carcinoma, bladder cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and extends into the c repeat sequences of HSV DNA. Compounds that inhibit HSV L/ST synthesis may be used as anti-HSV virucides. The HSV-1 DNA sequence in the region of the L/STs is given in Q76213.

An HSV-specific junction-spanning transcript (L/ST) maps at the end to the b repeat sequences of HSV DNA at approx. 3 and 125 and extends into the c repeat sequences of HSV DNA. Compounds that inhibit HSV L/ST synthesis may be used as anti-HSV virucides. The HSV-1 DNA sequence in the region of the L/STs is given in Q76213.

Sequence 12001 BP; 1568 A; 4557 C; 4315 G; 1561

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δõ
                                                                                                                                                                   New polynucleotide encoding PACE endo-peptidase - used for e.g.
reducing blood pressure
Sclaim 1; Figure 1; 81pp; English.
The mammalian endopeptidases PACE 4 and PACE 4.1 (an alternative form of PACE 4) are involved in the production of mature polypeptides from precursor polypeptides by cleavage at pairs of Dasic amino acids e.g Lys-Ray, Lys-Lys and Arg-Arg. The enzymes are stimulated by the presence of calcium ions and inhibited by phenylmethyl sulphonyl fluoride. PACE 4 and 4.1 convert prorenin to renin in the human kidney, causing elevation of blood pressure. They can therefore be used to identify other inhibitors of their action and may also be used to inhibit blood coagulation.

                                                                                                                                                                                                                                                                                                                                                                                      δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide encoding PACE endo-peptidase - used for e.g. reducing blood pressure

Example 2; Figures 1 and 3; 8lpp; English.

The mammalian endopeptidases PACE 4 and PACE 4.1 (an alternative form of PACE 4) are involved in the production of mature polypeptides from precursor polypeptides by cleavage at pairs of polypeptides from precursor polypeptides by cleavage at pairs of pasic amino acids e.g Lys-Arg, Lys-Lys and Arg-Arg. The enzymes are stimulated by the presence of calcium ions and inhibited by phenylmethyl sulphonyl fluoride. PACE 4 and 4.1 convert prorenin to renin in the human kidney, causing elevation of blood pressure. They can therefore be used to identify other inhibitors of their action and may also be used to inhibit blood coagulation.

The herpes simplex virus (HSV) alpha-4 gene encodes infected cell protein number 4 (ICP4). Both the alpha-4 gene and ICP4 can be used to block cell apoptosis. Similarly the administration of an agent that inhibits ICP4 or the alpha-4 gene can induce apoptosis in HSV infected cells. This can be used for the immortalisation of cells, production of proteins, gene therapy, or inhibition of cells death induced in vivo. They can also be used for production of therapeutics comprising inhibitors of HSV ICP4 function, useful for treating HSV function.

Example 2; pages 60-63; 85pp; English.

This is the nucleotide sequence of Herpes simplex virus ICP4 used in the method of the invention as modulators of apoptosis. The methods and products can be used to identify compounds which modulate (stimulate or inhibit) apoptosis in cells. They can be used to immortalise cells for the study of these cells or for growing cells in large numbers for the productions of proteins. They can also be used for stimulating apoptosis in cells, e.g. for treating a subject with a HSV infection.

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic search, using sw model

CThe present sequence encodes a human neuronal nicotinic acetylcholine receptor (NAChR) subunit. The cells expressing the alpha and/or beta NAChR subunits may be used in a method of screening compounds to identify any which modulate the activity of human neuronal NAChR. Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain tissues. Testing of single receptor subunits or specific receptor subunit combinations with a variety of potential agonists or antagonists provides information with respect to the function and activity of the individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or more receptor subtypes. The resulting drugs should exhibit fewer unwanted side effects than drugs identified e.g. screening with cells that express a variety of subtypes.

Nucleic acid encoding variant of human alpha7 nicotinic acetyl-choline receptor sub-unit - used to identify modulators of the receptor, potentially useful for treating neuro-degeneration, cancer, affective disorders etc.

Claim 14; Fig 2: 44pp; English.

This sequence encodes the v2477 variant of human alpha7 nicotinic acetylcholine receptor (nAChR) subunit of the invention. Cells containing the DNA are used to express the protein and to identify modulators of alpha7 nAChR activity or cytoprotective agents, e.g. antisense compounds or antagonists that are potentially useful for treating annumentation answer dvsfunction, affective disorders and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-OCT-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ğ
                          New isolated neuronal alpha-bungarotoxin-binding protein DNA - used to screen cholinergic agents and other drugs which may affect ligand protein pinding; ion channel or other activities of the protein.

Claim 1; Fig 2A-B; 18pp; English.

C aDNA clones (T59196 and T59197) respectively code for the alphal subunit (W12369) of chick neuronal cubin (W12368) and alpha2 subunit (W12369) of chick neuronal subunit (W12369) of chick neuronal cubina-bungarotoxin binding protein (ABBP). They were isolated from an 18-day embryo chick brain cDNA library using a probe (see also T59198) based on the N-terminal amino acid sequence of chicken cubrain ABBP. The probe isolated partial clone pCh29-1, which encoded the N-terminal portion of alpha1. A subclone, pCh29-3 (ATCC 40641), was used to rescreen the library, yielding clone pCh31-1 (ATCC 40640), which encoded the entire alpha2 sequence. A probe based on the C-terminal region of pCh31-1 was used obtain clone pCh34-1 (ATCC 40649), encoding the C-terminal portion of alpha1. The cDNA clones can be used as probes to identify further capha1. The cDNA clones can be used as probes to identify further capha1. The cDNA clones can be used as probes to identify further capha2 since the combinant production of ABBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       psychosis and schizophrenia. Probes based on the DNA are used to detect the DNA in usual hybridisation or amplification tests; while monoclonal antibodies are used to detect the protein for diagnosis (in vitro or by in situ immuno-fluorescent assay). Compared with wild-type alpha7 nAChR, the protein has about 100-fold greater sensitivity to cholinergic receptor agonists (nicotine or acetylcholine) and response to these agonists decays more slowly, but the wild-type inward rectification is

DR P-PSDB; W12369.

PT New isolated neuronal alpha-bungarotoxin-binding protein DNA - used PT to screen cholinergic agents and other drugs which may affect ligand binding, ion channel or other activities of the protein.

PT binding, ion channel or other activities of the protein.

CC claim 1; Fig 3A-B; 18pp; English.

CC an 18p-day embryo chick brain claim (ABBP). They were isolated from CC an 18p-day embryo chick brain cNA library using a probe (see also CC an 18p-day embryo chick brain cNA library using a probe (see also CC an 18p-day embryo chick brain cNA library using a probe (see also CC an 18p-day embryo chick brain con althal. A subclone, pch39-3 (ATCC 40641), was used to rescreen the library, yielding clone CC (ATCC 40641), which encoded the entire alpha2 sequence clone pch34-1 (ATCC 40639), encoding the C-terminal portion of alpha1. The cDNA clones can be used as probes to identify further Sc Sequence 2101 BP; 582 A; 406 C; 454 G; 659 T;

PT Transcriptional regulator gene family containing bromodomain - way properly be expressed in testis tissue and is useful for treatment of cancer proliferative disorders

PT and other proliferative disorders

CC This sequence encodes the human BAZ1-beta protein, a member of a CC family of transcriptional regulator genes containing a bromodomain (BAZ, in testis tissue and also in certain tumour lines. Transgenic cells may CC be used for the preparation of the BAZ1-alpha, BAZ1-beta proteins. These proteins can be used in the treatment of cancer their binding ability to the expression products (e.g. for use as drugs sequence 5561 BP; 1665 A; 1261 C; 1471 G; 1164 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and other proliferative disorders

Claim 2: Page 145-157; 187pp; Japanese.

This sequence encodes the human BAZ1-beta protein, a member of a family of transcriptional regulator genes containing a bromodomain (BAZ, Bromodomain with Atypical Zinc finger) which are expressed specifically in testis tissue and also in certain tumour lines. Transgenic cells may be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and BAZ2-beta proteins. These proteins can be used in the treatment of cancer and other proliferative disorders, and in screening of compounds for their binding ability to the expression products (e.g. for use as drugs by modulation of transcriptional regulation).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or more diseases, conditions or mixtures. The antisense oligonucleotides can be derived from sequences x55272-74. These multiple target coligonucleotides (specifically x55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, concluding lung diseases, pulmonary vasoconstriction, inflammation, concluding lung diseases yndrome, pain, cystic fibrosis, pulmonary concludinary vasoconstriction, emphysema, chronic obstructive culmonary disease (COPP), and cancers such as luekemias, lumphomas, cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasize to the lungs, including breast and prostate cancer.

Plasmid pzpc13 (ATCC 67893) was 1 solated from a cDNA library in lambda ZAP II prepd. from rat CC mRNA. The sequence of the CDNA in the region encoded by the 5th CC exon is identical to that determined for the genomic clone with CC the exception of a sustn. at posn. 720 of a t for a c (this does not alter the AA sequence); this may be due to a polymorphism CC between the rat strains used for the genomic library and the cDNA CC during prepn. of the cDNA. A sequence, the core of which is 44 bp CC long is repeated three times at the beginning of the 3' UT region. CC The function of this remains unknown. The protein subunit can CC combine with the known subunits, alpha-2,-3, and -4, and beta-2 cis expressed in the central and peripheral nervous systems and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ុ និនិនិនិនិនិនិនិនិនិនិនិនិនិ

PT New transcription factor designated FREAC11 which regulates
PT adipose tissue expressed genes involved in lipid metabolism and
PT adipose tissue expressed genes involved in lipid metabolism and
PS Claim 1; Fig 1; 23pp; English;
CC This sequence represents the Freac11 gene of the invention. The encoded
CC This sequence represents the protein is involved in lipid metabolism
CC This sequence represents the Freac11 gene of the invention. The encoded
CC tissue expressed genes. The protein is involved in lipid metabolism
CC and/or adipocyte differentiation. FREAC11 is selectively expressed in
CC expressed genes. The DNA or protein can be used as drugs for treating
CC adipose tissue, and is used for transcriptional regulation of adipocyte
CC expressed genes. The DNA or protein can be used as drugs for treating
CC adipocyte expressed genes, e.g. FREAC11 can be used as a drug that blocks
CC antisense constructs of Freac11 can be used as a drug that blocks
CC antisense constructs of Freac11 can be used to down regulate expression;
CC the cis elements of adipose expressed genes to inhibit gene expression;
CC antisense that affect the activity of FREAC11, such as inhibitors,
CC antagonists, or agonists. Conditions which can be treated include
CC diseases, catabolic conditions, anorexia, bulimia.

Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, leather and synthetic polymers. The enzyme produces a starch stated to have deliferent physicochemical properties, especially viscosity and sequence 2383 Bp; 582 A; 546 C; 633 G; 622 T;

Altering expression of genes encoding thrombopoletin, DNase I or beta-interferon - using DNA constructs useful in gene therapy to treat, e.g. cystic fibrosis and multiple sclerosis.

Claim 7; Fig 4A-D; 115pp; English.

A genomic DNA fragment (T35520) corresponds to nucleotides -6373 to -1886 upstream of the initiation codon of the human thrombopoletin (TPD) gene. It forms part of a DNA clone isolated from a human leukocyte genomic DNA library; another portion of the clone, comprising part of the 5' untranslated region and coding sequences of the TPO gene, is given in T35521. Non-coding genomic sequences, e.g. exon 1, within and upstream of the transcribed regions of the TPO gene may be used as targeting sequences in DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an isolated nucleic acid molecule which has been isolated and comprises a nucleotide sequence encoding a polypeptide having soluble starch synthase (SSS) activity, where the polypeptide is encoded by a maize gene. The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered starch. Sequence 2990 Bp; 758 A; 655 C; 801 G; 776 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
Best Local Similarity
nucleic acid substitution, deletion, insertion or inversion or a combination of these. The preferred substitutions are a combination of substitutions are a combination of substitutions selected from those where the nucleic acid is modified so that the codon encoding His at position 37 is replaced on the encoding Ary, the codon encoding Glu at position 355 is changed to one encoding Asp, and the codon encoding Val at position 375 is changed to a codon encoding Ala. A mutation in the control elements of the ORF localised in an intergenic sequence may also result in a failure of expression of the polypeptide.
                                                                                                                                                      reading frame, used partic. In vaccines for immunising pigs.
Claim 1; Page 23-24; 33pp; English.
A pseudorables virus with a mutation in this open reading frame can be used in the production of vaccines for combatting infectious diseases in pigs. The pseudorables virus mutant produced fails to produce the antigenic or functional polypeptide described in R51272 and expresses a polypeptide with altered antigenic or functional properties or one that is non-funtional. The mutation is either a
                                                                                                                                                                                                                                                                               New pseudo:rables virus mutants - having a mutation in an opreading frame, used partic. in vaccines for immunising plgs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       constructs useful for gene activation by homologous recombination. Novel genes are generated in which exogenous and endogenous exons are operatively linked. Expression of TPO encoded by the endogenous gene is activated, providing a means for the gene therapy of thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300 GAG

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. "
